

CO₂ PIPELINES

PART OF OUR CLEAN ENERGY FUTURE

Many things we need emit carbon dioxide. Keeping American manufacturing jobs in a future clean economy will require capturing carbon emissions before they reach the atmosphere. Pipelines are ideal for moving large volumes of CO₂ emissions long distances to permanent underground storage sites.

TRACK RECORD OF SAFETY

- CO₂ pipelines have been operating safely in the United States for decades. Today, there are over 5,000 miles of pipelines delivering CO₂ pipelines.
- Congress expanded federal pipeline safety law in 1988 to require regulation of CO₂ pipelines. PHMSA extended federal regulatory requirements to CO₂ pipelines in 1989.
- Federal pipeline safety regulations require CO₂ pipeline operators to proactively inspect and perform preventive maintenance on their systems. Pipeline personnel monitor their systems 24/7 to ensure everything is running safely.
- According to federal government safety data, CO₂ pipelines are the safest liquids pipeline systems. Over the last 5 years, CO₂ pipelines are 55% less likely than crude oil pipelines to have an incident and 37% less likely than refined products pipelines.

CLEAN ENERGY JOBS

CO₂ pipelines offer a great opportunity for creating new clean energy jobs. Building pipelines provides jobs for thousands for welders, equipment operators, engineers and more. Pipeline construction jobs can support a family with wages topping \$30 an hour.
